

Dark Green - Regenerative

Complex

Characterised by long-term emergence, these require new paradigms of leadership, cooperation, and value, developed through iterative learning.

- Define new corporate value systems centred on ecological, social, and spiritual success
- Embed deep ecological and ethical philosophies into daily business practices
- Design solutions that function within interdependent systems and long feedback loops
- Host participatory public engagement processes for shared futures thinking
- Develop governance and decision-making models under conditions of deep systemic uncertainty

Chaotic

These are unanticipated breakdowns or extreme pivots that require urgent, decisive action—often in uncharted territory.

- Navigate industry collapse or planetary tipping points that invalidate current business models
- Manage full-scale transformation projects that stretch team capacity or break stakeholder trust
- Face severe cultural backlash or boycotts over misunderstood sustainability shifts
- Absorb abrupt disruptions in strategy due to ecological disasters or social collapse

Regenerative

- Sustainability advocacy
- Business, planet and people
- Sustainability innovation investment

Confused/Disorder

This is the most ambiguous domain—where organisations struggle to locate themselves on the spectrum or to reconcile competing futures.

- Leadership paralysis or internal conflict over identity, ethics, or strategic future
- Governance breakdown as legacy structures fail to accommodate regenerative transformation
- Friction between traditional corporate structures and emerging systemic sustainability imperatives

Complicated

These areas require foresight, planning, and expertise to connect deep sustainability goals with business systems or technical execution.

- Develop metrics for measuring impact beyond carbon (e.g., biodiversity restoration, social capital creation)
- Align biophilic, indigenous, or ethical design principles with contemporary commercial systems
- Build infrastructure and market fit to scale regenerative product innovations
- Create long-range (50- to 100-year) scenario plans and impact foresight models
- Align marketing, supply chain, and strategy teams around new sustainability narratives

Simple (Clear)

Actions at this level are straightforward to implement and widely accepted, yet still represent a strong regenerative baseline.

- Commit to a "net positive" or "regenerative by design" corporate goal
- Include non-human stakeholders (e.g., nature, future generations) in executive or board decision-making
- Add long-term sustainability roles into corporate governance frameworks
- Develop products designed for long-term reuse, ecosystem benefit, or circularity
- Update branding to reflect regenerative purpose and planetary responsibility
